Scientific work

Has worked mainly on problems related to protein sorting and membrane protein biogenesis and structure. The work includes both bioinformatics methods development (e.g., methods for prediction of signal peptides and other sorting signals as well as prediction of membrane protein topology) and experimental studies in *E. coli* and eukaryotic systems.

The most important achievements include the discovery and experimental validation of the so-called “(-1,-3)-rule” (describes signal peptide cleavage sites; *EJB* 133:17, *JMB* 184:99) and the “positive inside” rule (describes membrane protein topology; *EMBO J* 5:3021, *Nature* 341:456, *Cell* 62:1135, *Cell* 77:401), the development of widely used prediction methods (e.g., TopPred, SignalP, TargetP, TMHMM; *JMB* 225:487, *Prot.Engineer.* 10:1, *JMB* 300:1005, *Nature Meth.* 8:785, *JMB* 305:567, *JMB* 327:735, *JMB* 340:783, *PNAS* 105:7177), the first proteome-wide theoretical and experimental studies of membrane protein topology in *E. coli* and *S. cerevisiae* (*Protein Sci.* 7:1029, *Science* 308:1321, *JMB* 35:489, *PNAS* 103:11142), the first quantitative analysis of the energetics of membrane protein assembly *in vivo* (*Nature* 433:377, *Science* 307:1427, *Nature* 450:1026, *PNAS* 106:11588; *Nature Struct.Mol.Biol* 19:1018; *PNAS* 113:10559), theoretical and experimental studies of so-called dual-topology membrane proteins and their role in the evolution of membrane protein structure (*Nature Struct.Mol.Biol.* 13:112, *Science* 315:1282, *Science* 328:1698, *PNAS* 114:7987), demonstration of dynamics in protein topology (*Nature Chem Biol*, 2019), and studies of cotranslational protein folding and secretion (*Nature Struct.Mol.Biol.* 19:1018; *PNAS* 110:14640; *Nature Struct.Mol.Biol.* 22:145; *Cell Rep.* 12:1533; *Nature Struct.Mol.Biol.*, 24:221; *eLife* 2021).

According to Web of Science (Google Scholar), the cumulated work has been cited ~85,500 (~127,00) times, h-index = 107 (127).
